

Whose bones are these?

Imagine your partner has been buried for 1000 years and you are the archaeologist who has found their skeleton. You need to carefully record everything that you find on the skeleton below.

Look at what your partner is wearing - what will survive in the ground for 1000 years and what will rot away? Describe the things that survive as if you are writing an archaeological report, just as we saw on the skeleton on the presentation.

Don't forget to measure your partner's height and check where they were born so you can write it next to their teeth.
